

Microtronics makes golden force measuring device

Recently, Microtronics, the Italian manufacturer of electronic instruments, sold the 5000th Blueforce force measuring device for automated gates and doors. To celebrate this milestone they made a golden force measuring device with Li-ion rechargeable battery.

The special golden version of the force measuring device was presented at the R+T exhibition in Stuttgart. "The R+T was a great opportunity for meeting lots of people from the trade, getting in touch with new distributors and greeting old customers in passing," says Biason. ■

"We are very pleased with the success our Blueforce has had with installers and manufacturers of gate automation," says Microtronics director Diego Biason. "Because this means that many people have chosen to trust our instruments to certify the safety of their work. We want to offer our customers the best possible products. That is why we regularly update our instruments and their software, so we always comply with European legislation. There are testers on the market that are no longer suitable, because they do not comply with the EN 12453 standard anymore since its most recent update. Our customers never have to worry about standard updates, because our force measuring devices always are and will always stay in accordance with the law."
